                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated nucleic acid that encodes a UDP-glucosyltransferase. The method of the invention may be used to transform microorganisms or green plant cells so that these produce a higher level of high-volume chemicals or materials, such as pHBA (p-hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a monomer for liquid crystal polymers (LCPs) and starting material for methylparaben. Methylparaben is a preservative commonly used in the food and cosmetic industries. The encoded enzymes may be used for in vitro production of these compounds and for identifying similar enzymes by sequence comparison. The current sequence is that of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding UDP-glucosyltransferase, useful for preparing cells that produce p-hydroxybenzoic acid glucose ester, also the new

                                                                                                                                                셤
                                                                                                                                                                                                                                    The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce abutin. Plants and microbes can be genetically engineered to produce increased that either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-bydroxycinnamoy-LoA hydrateses/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is tomato rubisco small subunit precursor (rbc22) transit peptide (chloroplast transit peptide; TP)-Escherichia coli CPL chimeric DNA. This sequence is present in the E. coli expression vector construct pET24a-TP-CPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LeuCysAlaAspGlyGluProTrpLeuAlaGlyArgThrValValProValSerThrLeu 100

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids acid (pHB) which comprises transforming microorganisms with plasmids carying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubiC gene encoding chorismate pyruvate lyase, arog tructural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phe), tktA gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, aroC gene encoding chorismate synthase, aroL gene encoding shikimate shinhase, aroL gene encoding converting chorismate to a selected aromatic compound. The method is used for converting chorismate to a selected aromatic compound. The method is aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is ubiC gene which encodes chorismate pyruvate lyase that
p-hydroxybenzoic acid; pHB; aromatic pathway; carbon source; ubiC; chorismate pyruvate lyase; ppsA; phosphoenolpyruvate synthase; ppsB; ppsB; phosphoenolpyruvate synthase; aroA; psB synthase; tktA; transketolase; aroC; chorismate synthase; aroA; 5-enolpyruvoylshikimate-3-phosphate synthase; BFSP synthase; aroL; shikimate kinase II; aroB; 3-dehydroquinate synthase; DHO synthase; aroG; 3-deoxy-D-arabino-heptulosonate-7-phosphate synthase; DHAP synthase; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing aromatic compounds, especially commercially acceptable levels of p-hydroxybenzoic acid, comprises developing genetically engineered bacteria that carry selected genes of the common aromatic pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Johnson BF, Amaratunga M;

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid (p-hydroxybenzoic acid; phBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-bydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antiminicrobial agent, anti-conformatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA 1-hydroxylase (PHB 1-H) - Becherichia coli chorismate pyruvate lyase (CPL) and Arabidopsis thaliana UDP-glucosyltransferase (UGT72B1) chimeric DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing hydroquinone glucoside in a green plant comprises growing a green plant having nucleic acid fragments and chorismate pyruvate lyase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 3452 BP; 932 A; 730 C; 856 G; 934 T; 0 U; 0 Other;

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids carrying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubic gene encoding chorismate pyruvate lyase, arof structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phe), tktA gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, arof gene encoding sene encoding sene and aroa chorismate synthase, arol gene encoding shikimate kinase II, aroA gene encoding 5-dehydroquinate (DHQ) synthase and aroa gene encoding 3-dehydroquinate (DHQ) synthase. The method is used for converting chorismate to a selected aromatic compound. The method is particularly used for the production of commercially acceptable levels of aromatic compounds, particularly p-hydroxybenzoic acid. The present aromatic pathway involved in the aromatic pathway

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid (p-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinamanoyl-Och hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidan, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA 1-hydroxylase (PHB 1-H) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing hydroquinone glucoside in a green plant comprises growing a green plant having nucleic acid fragments and chorismate pyruvate lyase expression cassette.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 7; SEQ ID NO 54; 70pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       80
                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence comprises the ubiquinone biosynthetic enzyme genes ubiC and ubiA, which were cloned from the chromosomal DNA of E. coli (Kohara map phage DNA bank IF8 (634); Cell 50, 495-508 (1987)). A large amt. of ubiquinone-10 can be produced by culturing photosynthetic bacteria transformed with the novel plasmid pR&FAC, which contains the ubiC and ubiA genes and the glutamate synthase gene promoter, specifically the Rhodobacter capsulatus transformant MC9R/pRSFAC
                                                                                                                                                                                                                                                                                                                ŏ

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) are to treat disease states involving (II). (II) is useful in seve as molecular weight markers and as a food cuseful for generating antibodies against it, detecting or quantitating a cuseful for generating antibodies against it, detecting or quantitating a cuseful for generating antibodies against it, detecting or quantitating a cuseful for generating antibodies against it, detecting or quantitating a cupypeptide in tissue, as molecular weight markers and as a food cupypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponalble for genetic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this conding sequence of the invention. Note: The sequence data for this conding sequence in the printed specification, but was obtained in conding sequence.
                                                                                                                                                                                                                                                                                                                                                         New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; SEQ ID NO 26139; 103pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MSHPALTQLRALRYCKEIPA.....RLSGKPLLLTELFLPASPLY 165

US-09-064-693A-25

Sequence 25, Application US/09064693A

Sequence 25, Application US/09064693A

Patent No. 6210937

GENERAL INFORMATION:

APPLICANT: Ward, Thomas E.

TITLE OF INVENTION: DEVELOPMENT OF GENETICALLY

TITLE OF INVENTION: DEVELOPMENT OF GENETICALLY

TITLE OF INVENTION: DEVELOPMENT OF GENETICALLY

TITLE OF INVENTION: OF A SPECIFIC PLASTICS PRECURSOR

NUMBER OF SEQUENCES: 26

CORRESPONDENCE ADDRESS: ADDRESSE: ADDRESSEE: Technologies Co.

STREET: ROW ENTION: DEVELOPMENT OF ASTRONY

STREET: DEVELOPMENT OF ASTRONY

STREET: DEAD OF ASTRONY

COUNTRY: USA

COUNTRY: USA

MEDIUM TYPE: Diskette, 3.5 inch, 1.44 Mb storage

COMPUTER: Toshiba Satellite Pro T2150CDS

SOFTWARE: Word Perfect 7.0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MSHPALTQLRALRYCKEIPA.......RLSGKPLLLTELFLPASPLY 165

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                        US-10-718-311-4
